Abstracts

According to our (Global Info Research) latest study, the global Noncontact Inductive Angle Encoders market size was valued at US\$ 755 million in 2024 and is forecast to a readjusted size of USD 1062 million by 2031 with a CAGR of 5.5% during review period.

A noncontact inductive angle encoder is a sensor that uses the principle of inductance to measure the angle of rotation. It accurately determines the angular position of a rotating element by detecting the change in inductance of the rotating element. Due to its non-contact measurement method, inductive angle encoders are highly durable and reliable, and are not affected by environmental factors such as dust and moisture. They are widely used in industrial automation, robotics, and precision machinery.
