Abstracts

The global Normally Open Fire Door Electromagnetic Release Unit market size is expected to reach \$ 338 million by 2032, rising at a market growth of 6.2% CAGR during the forecast period (2026-2032).

In 2025, the global production volume of Normally Open Fire Door Electromagnetic Release Units reached 5.16 million units, with an average selling price of \$42 per unit. A Normally Open Fire Door Electromagnetic Release Unit is an electronically controlled release device used in conjunction with normally open fire doors as part of a fire safety interlocking system. Under normal conditions, the unit remains energized, magnetically holding the door leaf open; in the event of a fire alarm or power failure, it releases the door leaf, allowing the fire door to close automatically via its door closer mechanism to establish fire and smoke compartmentalization. Typical application environments include hospitals, offices, cinemas, airports, hotels, factories, schools, corridor junctions, and commercial complexes. The upstream segment primarily involves components such as electromagnetic coils, iron cores/armature plates, die-cast metal or engineering plastic housings, springs and ball-joint adjusters, wiring terminals, power modules, surface coatings, and fasteners. The midstream segment encompasses the design, assembly, certification, and channel sales of the electromagnetic fire door holder units themselves. The downstream segment connects to fire doors, door closers, fire alarm systems, smoke detection systems, access control/building management systems, and fire safety engineering projects within commercial buildings. Gross margins typically range from approximately 25% to 40%.
