Abstracts

According to our (Global Info Research) latest study, the global Normally Open Solid State Relay market size was valued at US$ 1052 million in 2025 and is forecast to a readjusted size of US$ 1473 million by 2032 with a CAGR of 5.0% during review period.

A solid-state relay (also known as an SSR, solid-state switch, or solid-state switch) is an integrated contactless electronic switching device consisting of an integrated circuit (IC) and discrete components packaged into a compact solid-state structure. According to the switching characteristics of electronic components (such as switching transistors, triacs and other semiconductor components), solid-state relays can switch the "ON" and "OFF" switching states of the load very quickly through electronic circuits, achieving the same functions as traditional mechanical relays . A normally open solid state relay will only open when a control signal is applied to the input terminal.

The Normally Open Solid State Relay (NO SSR) is an increasingly popular device in the fields of electronics and electrical control. Compared to traditional electromagnetic relays, it offers higher reliability and lifespan because it lacks mechanical contact parts, reducing the risk of wear and failures. In terms of market trends, as industrial automation and intelligence continue to advance, there is a growing demand for control components that are highly reliable and have fast response times. Therefore, NO SSRs find extensive use in various applications such as automation systems, temperature control, lighting control, and more. It is anticipated that their market share will continue to expand in the future.
