## Abstracts

Air Source Heat Pump (ASHP) is a device which uses a vapor compression cycle to transfer heat between outdoor air and indoor air or water. There are two type of air source heat pumps including air-to-air heat pumps and air-to-water heat pumps. As the name implies, these systems heat or cool indoor air or move energy into water. An air-source heat pump can provide efficient heating and cooling for your home, especially if you live in a warm climate. When properly installed, an air-source heat pump can deliver one-and-a-half to three times more heat energy to a home than the electrical energy it consumes. This is possible because a heat pump moves heat rather than converting it from a fuel, like in combustion heating systems.
