Exhaust gas recirculation (EGR) is a NO_x emission control technique applicable to a wide range of diesel engines from light-, medium- and heavy-duty diesel engines right up to two-stroke low-speed marine engines. The configuration of an EGR system depends on the required EGR rate and other demands of the particular application.

SCOPE OF THE REPORT:

This report focuses on the Automotive EGR System in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

According to the report, one of the key drivers of the market is the regulation of NO_x emission from diesel and gasoline engines. To comply with rigorous NO_x emission regulations, a combination of NO_x reduction catalysts and EGR systems is used.

Vehicles in European countries undergo stringent checks for compliance with emission standards. Japan and the US have adopted similar regulations. Governments issue such emission regulations to reduce the effects of harmful gases on human health and the environment. The primary aim of these legislations is to reduce the release of NO_x and PM from the vehicle's fuel.

At present, the leading companies in the market are BorgWarner, Denso, Rheinmetall Automotive, Delphi and Continental, this top 5 player occupied about 55% market share in 2016. The market size of global automotive exhaust gas recirculation systems was about 2280 M\$ in 2016. In 2013, the consumption of global automotive exhaust gas recirculation valves and coolers grew at a double digit growth rate for the emission regulations effects, while in China, due to the China IV emission standard, the rapid growth in the consumption of automotive exhaust gas recirculation valves occurred in

2014.

The growth of the Global Automotive EGR systems market may be impacted by the increased adoption of SCR over EGR systems technology, which has led to a decrease in the usage of EGR systems. SCR is a technology adopted by many automobile manufacturers, which uses AdBlue to convert excessive NOx gases into water and nitrogen.

The major challenge in this market is the adoption of SCR over EGR in diesel engines. SCR is a technology that converts the excessive NOx gases produced in the engine to water and nitrogen. It enables the engine to operate under optimized combustion conditions such as high temperature, high peak pressure, and excess oxygen.

The worldwide market for Automotive EGR System is expected to grow at a CAGR of roughly 6.8% over the next five years, will reach 3630 million US\$ in 2023, from 2450 million US\$ in 2017, according to a new GIR (Global Info Research) study.
