Abstracts

Logistics and supply chains for spare parts are different from those of finished products because the market for them is unstable. Many manufacturing companies are facing challenges because of an increase in operational costs and a decline in demand from consumers. Vendors of logistics services should be efficient in the provision of IT, data management, and SCM services. Accurate forecasting of demand takes systematic and proper planning, purchasing, and ordering of logistics operations. Logistics is the framework used to transport spare parts such as machine components, tools, and equipment required for the manufacture of new vehicles and replacement of defective parts. These parts can be transported by road, sea, rail, and air. Spare parts are also known as replacement parts, service parts, and repair parts. Spare parts are stored by vendors to be used when the demand arises for replacement or repair of a product. The demand for spares is characterized by fluctuations and volatility. It is affected by stochastic factors such as the intensity of product use, wear behavior, failure rates, and type of maintenance.
