Chemical mechanical polishing/planarization (CMP) slurries are abrasive materials, also called non-crystalline inorganic oxides, which are dispersed in water blended with other chemicals and used in CMP processes for semiconductors. CMP process is employed in semiconductor manufacturing, where surfaces of wafers are smoothed and leveled with the help of abrasive slurries. This process is critical for precise lithography patterning, and is utilized after every deposition-etch step.

CMP slurries are liquid solutions generally composed of high-purity deionized water and a proprietary mix of chemical additives and engineered abrasives that chemically and mechanically interact at an atomic level with the surface material of the IC device.

QYR believe the semiconductor industry continues to exhibit various trends, including: demand within the semiconductor business is driven primarily by MIDs, secondarily by personal computers (PCs), as well as a wide range of other electronic applications including high-performance computing and artificial intelligence; overall industry demand fluctuates.

The manufacturers compete in the Chemical Polishing slurries sector, which is characterized by advances in technology and demanding requirements for product quality and consistency. The manufacturers face competition from other CMP slurries suppliers, also face competition in the future from significant changes in technology or emerging technologies.
