Abstracts

A compression fitting is a type of coupling used to connect two pipes or a pipe to a fixture or valve. A compression coupling works by using clamping force to seal the fitting. The unit commonly consists of a compression nut, a compression ring and a seat. The compression ring, often called a ferrule, is placed on the tubing with the nut behind it. The tubing is then inserted into the seat, and the nut is screwed onto the seat. As the nut is tightened, it compresses the ring around the tubing, creating a leak-free seal.
