Abstracts

CIPP, is one of several pipe rehabilitation methods referred to as Trenchless Technologies. It is an approved method and preferred method to rehabilitating cracked, broken and failed sanitary or storm sewer pipes. Lining is less expensive and more efficient than traditional open cut replacement methods, normally installed with little or no surface disruption. CIPP lining process can be used to rehabilitate virtually any type of pipe including; Clay, Cast Iron, Orangeburg, PVC, ABS, HDPE, Concrete Pipe or Corrugated Metal Pipe.

SCOPE OF THE REPORT:

This report focuses on the Cured-In-Place Pipe (CIPP) in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. CIPP is a resin-saturated felt tube or robust sleeve composed of polyester that is inverted or pulled into aging and damaged sewer pipes. Typically, the CIPP lining tube is inserted into the damaged pipe with either air pressure or water pressure. Hot water or steam is used to cure the resin which then forms a solid, impregnable mass that lines the interior dimensions of a sewer pipe, taking the form of the pipe and providing a seamless, tight fitting and corrosion-resistant lining.

CIPP can be divided by various types according to materials or installation method. When considering the installation method in a project, inversion method is the most widely used.

Global consumption of CIPP increased from 4104.9 Kilometer in 2013 to 2698.6 Kilometer in 2018. Key consumption regions are North America and Europe. The two regions consumed 76.14% CIPP globally in the year of 2017.

The worldwide market for Cured-In-Place Pipe (CIPP) is expected to grow at a CAGR of roughly 4.3% over the next five years, will reach 140 million US\$ in 2023, from 110 million US\$ in 2017, according to a new GIR (Global Info Research) study.
