Abstracts

In internal combustion engines, exhaust gas recirculation (EGR) is a emissions reduction technique used in petrol/gasoline and diesel engines to reduce nitrogen oxide. EGR works by recirculating a part of an engine's exhaust gas back to the engine cylinders. In the case of gasoline engines, this inert exhaust displaces an amount of combustible gas from the cylinder. In diesel engines, the exhaust gas replaces parts of the excess oxygen in the pre-combustion mixture. The fuel mixture combusts, causing clatter of valves and damages the engine. Allowing small amounts of gas into the chamber reduces the temperature. Regulating the exhaust is done by the EGR Valve. EGR technology offers automobile producers a reliable, compact and cost-effective method to improve fuel efficiency and reduce emissions, and is fast catching up the standard solution for gasoline hybrid propulsion systems. It increases the output of the fuel. The EGR Valve Minimizes throttling losses reduce chemical disassociation, reduces heat reduction.

SCOPE OF THE REPORT:

This report focuses on the Exhaust Gas Recirculation (EGR) Valve in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

According to the report, one of the key drivers of the market is the regulation of NOx emission from diesel and gasoline engines. To comply with rigorous NOx emission regulations, a combination of NOx reduction catalysts and EGR systems is used.

Vehicles in European countries undergo stringent checks for compliance with emission standards. Japan and the US have adopted similar regulations. Governments issue such emission regulations to reduce the effects of harmful gases on human health and the environment. The primary aim of these legislations is to reduce the release of NOx and PM from the vehicle's fuel.

The growth of the Global EGR valves market may be impacted by the increased adoption of SCR over EGR systems technology, which has led to a decrease in the usage of EGR systems. SCR is a technology adopted by many automobile manufacturers, which uses AdBlue to convert excessive NOx gases into water and nitrogen.

The worldwide market for Exhaust Gas Recirculation (EGR) Valve is expected to grow at a CAGR of roughly 7.3% over the next five years, will reach 1100 million US\$ in 2023, from 720 million US\$ in 2017, according to a new GIR (Global Info Research) study.
