## Abstracts

This report studies the Fire Retardant Treated Wood market, from angles of players, regions, product types and end industries, to analyze the status and the future. Whether installing fire-rated panels due to personal safety concerns or because of adherence to the specific building codes and jurisdiction in which you live, is important to know something about the various aspects of fire retardant treated (FRT) wood and its benefits. Fire retardant treating is available for both plywood and for building lumber, which together comprise the majority of the structural wood elements for most buildings. The sections below will describe the types of FRT wood available, how they are made, and their various uses.

### Creation of FRT Wood

Fire retardant wood products are typically created through the use of organic and inorganic salts, which are infused into the wood through water-based solutions under pressure. The end result is a product that has 2.5 to 5.0 pounds of salts per cubic foot of wood product. Not all species of wood are treatable, and the species that is certified for treatment for lumber may not necessarily be certified for treatment as plywood and vice-versa.

### Mechanism of Fire Retarding Wood Products

Fire retardants in wood work through two primary mechanisms. The first is reduction of wood flammability by reducing flame travel rate, thereby slowing down the combustion process. Secondly, the chemicals reduce the rate which heat is released from the wood during a fire. The fire retardants alter the vapors released during the combustion process by making them less volatile.
