## Abstracts

Lead-based batteries are the world's most recycled consumer product – we have a 99 percent recycle rate in North America. Here's how we recycle a spent automotive battery into new batteries and other new and useful products.

### SCOPE OF THE REPORT:

This report focuses on the Lead Recycling Battery in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

Lead-based batteries are the world's most recycled consumer product.

The rising stringency of government regulations pertaining to reducing the emission of greenhouse gases and the protection and conservation of the environment has given the global battery recycling services market all the push it needs. Growing awareness about recycling among the general population has also resulted in the surge in battery recycling, signaling the immense potential this market possesses. Battery manufacturers around the world have also realized the environmental and health hazards of used batteries and have been setting up their own recycling centers.

The level of awareness regarding pollution control and energy conservation is rather high among the people in Europe, resulting in the rising demand for battery recycling services. This demand is also supported by the participation of various government institutions. The strict implementation of various rules pertaining to the proper disposal of used batteries and the strong support for recyclers in the form of compensations have greatly boosted the battery recycling services market in Europe.

Stringent environmental regulations and the rising exports from developing and developed countries are anticipated to give the APAC battery recycling services market

a significant push in the next few years.

Batteries are made up of various materials such as cadmium, lead, lithium, mercury, nickel, manganese, and zinc, and quite a few of these are extremely toxic. Used batteries, if not disposed of properly, can result in hazardous health and environmental conditions.

Lead Recycling Battery produces a host of hazardous wastes, including lead, cadmium, arsenic and volatile organic compounds.

Although the practice of battery recycling has been gaining strength at the industrial level with electronic appliances and automotive companies setting up their own recycling centers, the awareness level of among final consumers continues to remain low. This lack of knowledge about battery recycling is likely to act as a major impediment to the growth of this market.

The worldwide market for Lead Recycling Battery is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
