## Abstracts

When assembly processes call for the interlinking of complex processes, linear transfer systems are used for the assembly, testing and inspection of components, and in particular when a deep vertical range of manufacture is required. These systems can also be interlinked with rotary indexing systems to accommodate complex tasks. The various processing stations are arranged in series to form a chain. This linear chain can be easily expanded and/or contracted, and changes in the assembly sequence can be quickly achieved by exchanging or regrouping the station inserts.

### SCOPE OF THE REPORT:

This report focuses on the Linear Transfer Systems in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

Linear transfer systems have been the backbone of the automation industry landscape for a long time. Or should we say, the back saver, as linear transfer automation has removed a lot of heavy lifting in the assembly industry as products are transferred from assembly station to the next assembly station for production. Homage should be paid to the grandfather of the linear transfer system. Henry Ford turned on his assembly line over a century ago and we've never looked back.

Linear motor pallet-transfer systems have been around for more than a decade. What was once a cutting-edge technology is now available in a variety of different models and configurations. New developments in mechatronics, networking and software are amplifying the unique benefits of these systems.

As the automation landscape changes, linear transfer systems will remain an integral piece of the production puzzle. Progress will come in the form of flexibility to processing

multiple products on a single platform and adapt to process change. Layout confinement will be combated with smart conveying vehicles such as AGV's no longer confine to the track or rail system of conventional linear transfer systems. Robots will become less reliant on part location and more adaptive open tolerance part presentation. But there will always remain a need to move product through linear transfer assembly.

The worldwide market for Linear Transfer Systems is expected to grow at a CAGR of roughly 5.0% over the next five years, will reach 550 million US\$ in 2023, from 420 million US\$ in 2017, according to a new GIR (Global Info Research) study.
