Abstracts

An infrared thermometer (sometimes called IR Pyrometer) is a thermometer which infers temperature from a portion of the thermal radiation sometimes called black-body radiation emitted by the object being measured.

SCOPE OF THE REPORT:

This report focuses on the Non-medical Infrared Thermometer in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.
Non-medical Infrared Thermometer is a type of spot or point measuring instrument. A point measuring infrared thermometer should be used if users know where the critical point or the area to be measured is positioned within users' application. It is therefore possible to monitor the accurate temperature and optimize processes – if necessary – before quality problems arise.
The high tech IR measuring instrument is Infrared cameras, or also call IR imagers. This type of product is not included in this report, it is a type of area measuring method. Infrared cameras should be used in cases where more than one critical area exists or the area cannot be clearly defined. Critical areas can be localized by the camera through the demonstration of thermal images. The areas can then be permanently monitored by one or multiple fixed infrared thermometers.

The worldwide market for Non-medical Infrared Thermometer is expected to grow at a CAGR of roughly 6.7% over the next five years, will reach 510 million US$ in 2023, from 350 million US$ in 2017, according to a new GIR (Global Info Research) study.
