Abstracts

Pharmaceutical An excipient is a natural or synthetic substance formulated alongside the active ingredient of a medication, included for the purpose of bulking up formulations that contain potent active ingredients (thus often referred to as 'bulking agents,' 'fillers,' or 'diluent'), or to confer a therapeutic enhancement on the active ingredient in the final dosage form, such as facilitating drug absorption or solubility. Excipients can also be useful in the manufacturing process, to aid in the handling of the active substance concerned such as by facilitating powder flowability or non-stick properties, in addition to aiding in vitro stability such as prevention of denaturation over the expected shelf life. The selection of appropriate excipients also depends upon the route of administration and the dosage form, as well as the active ingredient and other factors.
