## Abstracts

Pulmonary drug delivery systems are used to the treatment of various respiratory diseases like asthma and chronic obstructive pulmonary disease (COPD), delivering locally acting drugs directly to their site of action. Advantages of pulmonary drug delivery systems over oral drugs is the excellent capability of absorbing pharmaceuticals, due to the large absorptive surface area of lungs (approximately 70-140 m<sup>2</sup> in adult humans having extremely thin absorptive mucosal membrane) and good blood supply.

### SCOPE OF THE REPORT:

This report focuses on the Pulmonary Drug Delivery Systems in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

With better performance, the development of DPIs is faster than the MDIs. In the future, DPIs will occupy larger market share and replace the MDIs gradually. In addition, the market share of nebulizers will be smaller.

As WHO said, the COPD will become the world's third-leading cause of death by 2030. With the air pollution more and more serious, patients with respiratory diseases will be more and more, which means larger and larger demand for pulmonary drug delivery systems.

The worldwide market for Pulmonary Drug Delivery Systems is expected to grow at a CAGR of roughly 5.3% over the next five years, will reach 3490 million US\$ in 2023, from 2560 million US\$ in 2017, according to a new GIR (Global Info Research) study.
