Abstracts

Resistive random-access memory is a type of non-volatile (NV) random-access (RAM) computer memory that works by changing the resistance across a dielectric solid-state material often referred to as a memristor. This technology bears some similarities to conductive-bridging RAM (CBRAM), and phase-change memory (PCM).

SCOPE OF THE REPORT:

This report focuses on the Resistive Random Access Memory in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

Resistive Random Access Memory is an emerging technology that combines the advantages of both RAM and Flash: The Resistive Random Access Memory is non-volatile, fast, cost effective and does not degrade even after many Program/Erase cycles. It has been studied and developed for the last decade and its commercial usage is expected to increase dramatically over the next few years.

The major focus of Resistive Random Access Memory technology is to replace traditional Flash memory and is widely viewed as the “most likely to succeed” Flash replacement, since it provides the performance and manufacturability advantages over competing replacement alternatives.

The worldwide market for Resistive Random Access Memory is expected to grow at a CAGR of roughly 70.6% over the next five years, will reach 7000 million US\$ in 2023, from 280 million US\$ in 2017, according to a new GIR (Global Info Research) study.
