Abstracts

Sheet molding compound (SMC) is both a process and reinforced composite material. The composite is a “ready to mold” glass or carbon fiber reinforced polyester material primarily used in compression molding. The SMC sheets are manufactured by dispersing long strands of chopped glass fibers or carbon fibers on a bath of polyester resin, vinylester resin or epoxy resin.

SCOPE OF THE REPORT:

This report focuses on the Sheet Molding Compound (SMC) in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. A key variable in the performance of SMC producers is raw material costs, specifically the speed at which any increase can be passed through to customers. The materials of SMC include SMC-specific unsaturated polyester resin, glass fiber, carbon fiber, etc. The prices of SMC-specific unsaturated polyester resin follow the oil price, with a lag, and movements can inject volatility into producer margins. In general, most producers structure the majority of their contracts to include a ‘pass through’ clause that smooth the impact.

The worldwide market for Sheet Molding Compound (SMC) is expected to grow at a CAGR of roughly 3.9% over the next five years, will reach 2360 million US\$ in 2023, from 1880 million US\$ in 2017, according to a new GIR (Global Info Research) study.
