Abstracts

Transcutaneous Oxygen Monitor is the device used for transcutaneous oximetry (TcPO₂ or TCOM), which is a local, non-invasive measurement reflecting the amount of O₂ that has diffused from the capillaries through the epidermis. Today, transcutaneous oxygen monitoring is clinically prevalent in various applications such as wound-healing assessment, hyperbaric medicine, amputation-level resoluteness and others.

Transcutaneous Oxygen Monitor consists of a combined platinum and silver electrode covered by an oxygen-permeable hydrophobic membrane, with a reservoir of phosphate buffer and potassium chloride trapped inside the electrode. A small heating element is located inside the silver anode. The oxygen monitor consists of a TcPO₂ channel, for which high and low alarm limits can be set, a temperature display channel and a heat channel.
