## **Abstracts**

A transformer core is typically made of a high perm material with little or no gap. Energy is transferred constantly from an AC source through the coupling of the lines of flux between the winding on the primary and the winding on the secondary. An ideal transformer provides minimum core losses and maximum power transfer, at a low cost in the least amount of space. Core materials for transformers are typically ferrites, strip wound products and, less commonly, powder cores.

### **SCOPE OF THE REPORT:**

This report focuses on the Transformer Cores in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa.
