## Abstracts

According to our (Global Info Research) latest study, the global Novel Antiviral Drugs market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

The mechanism of action of antiviral drugs is mainly to inhibit the entry of viral particles into host cells and to inhibit the early stages of viral replication. There is also an inhibitor of DNA polymerase, which is mainly due to its ability to inhibit viral coding. At present, new antiviral drugs are actively seeking host factors, both in the initial stage of viral infection and in the later stages of nuclear transport of viral RNP complexes, to produce new drugs with new modes of action without drug resistance.

The global pharmaceutical market is 1475 billion USD in 2022, growing at a CAGR of 5% during the next six years. The pharmaceutical market includes chemical drugs and biological drugs. For biologics is expected to 381 billion USD in 2022. In comparison, the chemical drug market is estimated to increase from 1005 billion in 2018 to 1094 billion U.S. dollars in 2022. The pharmaceutical market factors such as increasing demand for healthcare, technological advancements, and the rising prevalence of chronic diseases, increase in funding from private & government organizations for development of pharmaceutical manufacturing segments and rise in R&D activities for drugs. However, the industry also faces challenges such as stringent regulations, high costs of research and development, and patent expirations. Companies need to continuously innovate and adapt to these challenges to stay competitive in the market and ensure their products reach patients in need. Additionally, the COVID-19 pandemic has highlighted the importance of vaccine development and supply chain management, further emphasizing the need for pharmaceutical companies to be agile and responsive

to emerging public health needs.
