Abstracts

According to our (Global Info Research) latest study, the global NPN and PNP Triodes market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The three connected terminals in the NPN and PNP transistors are called emitter (emitter, E), base (base, B) and collector (collector, C) in sequence. NPN uses the current of B?E (IB) to control the current of C?E (IC), the potential of the E pole is the lowest, and the potential of the C pole is usually the highest during normal amplification, that is, $V_C > V_B > V_E$. PNP uses E?B current (IB) to control E?C current (IC). The potential of the E electrode is the highest, and the potential of the C electrode is usually the lowest during normal amplification, that is, V_C
