Abstracts

The global NPN and PNP Triodes market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The three connected terminals in the NPN and PNP transistors are called emitter (emitter, E), base (base, B) and collector (collector, C) in sequence. NPN uses the current of B?E (IB) to control the current of C?E (IC), the potential of the E pole is the lowest, and the potential of the C pole is usually the highest during normal amplification, that is, $V_C > V_B > V_E$. PNP uses E?B current (IB) to control E?C current (IC). The potential of the E electrode is the highest, and the potential of the C electrode is usually the lowest during normal amplification, that is, V_C
