Abstracts

The global Nuclear Grade Spiral Wound Gasket market size is expected to reach \$ 64.73 million by 2032, rising at a market growth of 5.0% CAGR during the forecast period (2026-2032).

Nuclear Grade Spiral Wound Gaskets are high-performance metal sealing components designed specifically for nuclear power plants. They are constructed by alternately spirally winding V-shaped or W-shaped metal strips with high-purity non-metallic materials (such as nuclear-grade flexible graphite), offering exceptional resistance to extreme temperature and pressure fluctuations as well as seismic activity.

Upstream materials primarily include thin strips of stainless steel (e.g., 316L, 304, 321) or nickel-based alloys, nuclear-grade flexible graphite strips, alternative fillers (such as PTFE or mica), materials for outer centering rings and inner rings (carbon steel or stainless steel), and welding consumables; notably, the nuclear-grade graphite filler requires high purity and low sulfur and chlorine content.

In 2025, global sales volume is approximately 300,000 units, with an average market price of around \$150 per unit; major manufacturers in the industry report gross profit margins of approximately 32%-45%.

This report studies the global Nuclear Grade Spiral Wound Gasket production, demand, key manufacturers, and key regions.
