## Abstracts

According to our (Global Info Research) latest study, the global Nuclear Medicine Cyclotron Systems market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

A Radiochemistry PET Cyclotron is a specialized type of particle accelerator used in the production of positron-emitting radionuclides for use in positron emission tomography (PET) imaging. PET is a nuclear medicine imaging technique that provides detailed information about the functioning of organs and tissues in the body.

PET cyclotrons are essential in the production of short-lived positron-emitting radionuclides, such as fluorine-18 (F-18), carbon-11 (C-11), and nitrogen-13 (N-13), which have relatively short half-lives. The short half-lives mean that these radionuclides decay rapidly, making it essential to produce them on-site at medical facilities where PET imaging is performed.

The use of on-site cyclotrons for PET radionuclide production allows for a continuous supply of radiopharmaceuticals, which is crucial for conducting PET imaging studies in real-time and ensuring that patients receive fresh radiotracers for accurate and high-quality PET scans.

The radiopharmaceuticals market had been experiencing steady growth and significant interest due to the increasing use of nuclear medicine procedures for diagnostic and therapeutic purposes. Radiopharmaceuticals are essential tools in nuclear medicine, and they play a crucial role in diagnosing various diseases, such as cancer, cardiovascular conditions, and neurological disorders.

The radiopharmaceuticals market had been growing steadily over the years. Factors contributing to this growth include advancements in radiopharmaceutical development, rising prevalence of cancer and cardiovascular diseases, and an aging population that drives the demand for diagnostic procedures.
