The NVH (Noise, Vibration and Harshness) characteristic of a car is one of the five major performance indicators of a car (the other four performance indicators are safety, economy, environmental protection and reliability). The NVH control of a car is achieved by controlling the noise and vibration of the relevant parts and subsystems in the car, and it gives the car users the most superficial and direct feeling. The NVH characteristic of a car is one of the comprehensive issues that the automotive industry and related automotive parts industries are concerned about. Statistics show that about 1/3 of the failures of a whole vehicle are related to the NVH problem of the car, and nearly 20% of the research and development expenses of major automobile companies in the world are invested in solving the NVH problem of the car. The NVH problem of the car involves multiple subsystems of the car (such as: body/frame system, powertrain suspension system, suspension system and exhaust system, etc.) and the matching relationship between the subsystems. It is a systematic and comprehensive problem involving multiple disciplines. This is also one of the reasons why there is no mature and universal product that can solve the various vibration and noise problems encountered in the car so far.
