## Abstracts

The global Nylon 3D Printing Machine market size is expected to reach \$ 4123 million by 2032, rising at a market growth of 5.2% CAGR during the forecast period (2026-2032).

A 3D nylon printer refers to an industrial grade additive manufacturing equipment that uses nylon materials (such as PA6, PA12, and other polyamides) as the main printing medium. Through processes such as selective laser sintering (SLS), multi jet melting (MJF), or fused deposition modeling (FDM), digital models are manufactured layer by layer into functional parts with high strength, wear resistance, and toughness. It is widely used in the production of structural components, gears, housings, and customized parts. In 2025, global Nylon 3D Printing Machine production reached approximately 63,873 Units, with an average global market price of around K US\$ 43.96 per unit.

Nylon 3D printers are in the stage of upgrading from prototype manufacturing tools to small-scale production equipment, with core growth driven by automotive lightweighting, aerospace weight reduction, and customized consumer electronics demand. The industry as a whole maintains rapid growth, but is still limited by factors such as complex material processing, high equipment costs, and difficulty in completely replacing large-scale injection molding production. The future development direction will focus on high-efficiency SLS and MJF equipment, material system optimization, and industry integration solutions.
