According to our (Global Info Research) latest study, the global γ -Aminobutyric Acid Receptor Agonists market size was valued at US\$ 2994 million in 2025 and is forecast to a readjusted size of US\$ 4465 million by 2032 with a CAGR of 5.6% during review period.

γ -Aminobutyric Acid Receptor Agonists are pharmaceutical agents that produce therapeutic effects primarily by activating GABA receptors or by generating clinically relevant GABA-B receptor-related agonist activity. Commercial products mainly include baclofen oral tablets, oral suspensions, granules, and intrathecal injections, immediate-release and extended-release sodium oxybate formulations, mixed oxybate salt oral solutions, and a limited number of regionally approved phenibut medicines. By enhancing inhibitory neurotransmission in the central nervous system, these products reduce neuronal excitability and are mainly used for central spasticity associated with multiple sclerosis, spinal cord injury, and other neurological disorders, as well as for narcolepsy, cataplexy, excessive daytime sleepiness, idiopathic hypersomnia, and selected regional neuropsychiatric indications. Key upstream inputs include baclofen, sodium oxybate, mixed mineral oxybate salts, phenibut, pharmaceutical-grade excipients, controlled-release polymers, flavoring agents, water for injection, sterile filtration materials, glass containers, and specialized pharmaceutical packaging. Major downstream customers include hospitals, neurology and neurosurgery departments, rehabilitation centers, sleep medicine centers, psychiatric institutions, specialty pharmacies, pharmaceutical distributors, and retail pharmacies. The estimated industry gross margin generally ranges from approximately 70% to 82%, with branded oxybate products and differentiated specialty formulations positioned toward the upper end of the range and conventional baclofen generics and regional prescription products

positioned toward the lower end.

The global γ -Aminobutyric Acid Receptor Agonists market has a two-tier structure characterized by concentrated high-value specialty medicines and fragmented mature generic products. Oxybate medicines are primarily used for narcolepsy and idiopathic hypersomnia and account for most industry revenue because of their relatively high annual treatment value, specialized prescribing requirements, and controlled distribution systems. Baclofen products are widely used for central spasticity, while conventional oral formulations have entered a mature generic stage with numerous regional suppliers. Competition in the conventional segment mainly centers on supply reliability, registration coverage, hospital access, procurement pricing, and manufacturing cost control. Intrathecal baclofen and differentiated oral formulations remain more concentrated because of their higher requirements for sterile production, dose control, specialist administration, and long-term patient management.

From a product development perspective, oxybate medicines are evolving from traditional high-sodium and multiple-dose nightly regimens toward low-sodium formulations, extended-release delivery, and reduced dosing frequency. Product differentiation is increasingly focused on dosing convenience, sleep maintenance, next-day function, sodium burden, safety management, and patient adherence rather than on efficacy alone. Development in the baclofen segment is concentrated in high-concentration oral suspensions, granules, swallow-friendly liquid formulations, and multi-strength sterile injections designed for intrathecal infusion. These formulation improvements address the needs of pediatric patients, patients with swallowing difficulties, individuals requiring precise dose titration, and patients with severe treatment-resistant spasticity. Overall, technological progress is driven more by formulation optimization, administration convenience, and specialist treatment integration than by replacement of the underlying pharmacological mechanism.

Market growth is supported by improving diagnosis of narcolepsy, idiopathic hypersomnia, and severe neurological spasticity, as well as by the expansion of sleep medicine, neurology, rehabilitation, and specialist pharmacy networks. Narcolepsy and idiopathic hypersomnia remain underdiagnosed or are often diagnosed after prolonged delays, leaving additional treatment demand to be released as physician awareness, referral pathways, and patient education improve. Severe spasticity also creates sustained demand for individualized and long-term treatment, supporting continued use of intrathecal baclofen and differentiated oral formulations. Broader reimbursement coverage, improved commercial insurance access, and stronger specialist treatment infrastructure may further increase patient access to high-value products. In emerging

markets, demand growth is expected to rely more heavily on generic baclofen availability, hospital coverage, and improvements in neurological care capacity.

The industry nevertheless faces significant regulatory, pricing, and substitution risks. Oxybate medicines are controlled central nervous system products and require strict prescribing, risk management, specialist distribution, and patient monitoring, which limits rapid expansion through conventional channels. The entry of authorized and conventional generics is expected to improve treatment access but will place downward pressure on the pricing and market share of established branded products. Conventional baclofen formulations face product commoditization, centralized procurement, and low-price competition, while intrathecal therapy remains constrained by procedure complexity and the availability of trained treatment centers. In the longer term, orexin receptor agonists, other wake-promoting medicines, and new treatment approaches for spasticity may divert part of existing demand. Competitive advantage will therefore increasingly depend on differentiated formulations, clinical evidence, reimbursement access, specialist distribution, supply reliability, and patient-management capabilities.
