According to our (Global Info Research) latest study, the global Ocean-Bottom Seismographic Observation System market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Ocean-bottom seismographic observation systems provide characterization of seismicity/earthquake activity along tectonic plate boundaries where two key phenomena can occur: large-magnitude subduction zone earthquakes and seismicity associated with migration of melt (magma) beneath the seafloor at underwater volcanoes. Because the seismometers are cabled and, hence, connected directly to shore, they can provide detection of earthquakes in real-time.
