Abstracts

Ocean energy (also sometimes referred to as marine energy, marine power, or hydrokinetic energy) refers to the energy carried by ocean waves, tides, salinity, and ocean temperature differences. The movement of water in the world's oceans creates a vast store of kinetic energy, or energy in motion. This energy can be harnessed to generate electricity to power homes, transport and industries.

Scope of the Report:

This report focuses on the Ocean Power in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

The burning of coal causes carbon dioxide emission, which has a major impact on the environment. However, it is one of the most commonly used sources for baseload power due to its low cost and easy availability. Governments across the world are adopting renewable energy to regulate carbon dioxide emissions to decarbonize the power system. The growing environmental concerns have forced countries to adopt a diversified energy mix by increasing the share of low/no carbon sources, such as wind, solar, geothermal, and ocean power.

Ocean energy has the potential to play a significant role in the future energy system, whilst contributing to the reduction of carbon emissions and stimulating economic growth in coastal and remote areas. Ocean energy has attracted increasing interest, particularly in the EU, which is currently at the forefront of ocean energy development.

The worldwide market for Ocean Power is expected to grow at a CAGR of roughly xx%

over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
