According to our (Global Info Research) latest study, the global OCS (Optical Circuit Switch) Switch market size was valued at US\$ 806 million in 2025 and is forecast to a readjusted size of US\$ 2352 million by 2032 with a CAGR of 16.7% during review period.

An all-optical switch (OCS) is a device that controls the path of optical signals in an optical communication network entirely through light, without converting them into electrical signals. They utilize mechanisms such as nonlinear optical effects, microelectromechanical systems (MEMS), or photonic crystals to guide optical signals from one optical fiber or channel to another, thereby achieving ultra-high-speed data routing. Because all-optical switches eliminate the need for photoelectric (O-E) and electro-optical (E-O) conversions, they significantly reduce latency and power consumption, making them ideal for high-speed, high-capacity networks such as data centers and future 6G infrastructure. In 2025, OCS switch sales reached approximately 29,162 units (including those produced and used by companies like Google), with an average price of approximately \$26,866 per unit and a capacity utilization rate of approximately 71.30%. Upstream companies primarily come from the optical device and materials sector, including suppliers of optical switch chips and MEMS devices, PLCs and silicon photonics devices, optical fibers and connectors, precision machinery and packaging materials, and control boards and embedded software modules. Downstream companies are mainly concentrated in data center network equipment integration, cloud services and hyperscale data center operation, and telecommunications operator backbone and metropolitan area network construction. The overall industry gross profit margin is approximately 45% to 65%. In the product cost structure, core optical switches and optical components account for approximately 40% of the total cost, optical fibers

and connection components account for approximately 15%, control systems and software account for approximately 15%, structural components and assembly testing account for approximately 15%, and R&D and after-sales support account for approximately 15%. Based on port size, they can be categorized into small-scale, medium-scale, and ultra-large-scale. On the demand side, the downstream demand list includes high-speed interconnection within AI computing clusters, east-west traffic scheduling in data centers, optimization of optoelectronic hybrid network architecture, pooling and elastic reconfiguration of computing resources, and channel-level scheduling of operator backbone networks. The downstream customer list mainly includes hyperscale cloud service providers, internet companies' self-built data centers, third-party IDC operators, communication equipment manufacturers, and telecom operators. On the business opportunity side, policy drivers are reflected in the construction of new data centers, upgrades to computing infrastructure, and continuously strengthened requirements for energy conservation and emission reduction. Technological innovation drivers are concentrated in large-port-scale optical switch arrays, highly integrated silicon photonics, and the maturity of automated optical layer scheduling software. Changes in consumer demand are reflected in the rising demand from data center operators for lower power consumption, higher bandwidth utilization, and more flexible network architectures, all jointly driving the evolution of all-optical switches from supplementary equipment to core network scheduling nodes.

Driven by the explosion of AI computing power and the demand for high-performance computing (HPC), the OCS switch (Optical Circuit Switch) market has ushered in significant opportunities. Major customers such as Google have verified the value of OCS in low-latency, high-bandwidth scenarios through TPU cluster networking. It is estimated that in 2026, Google's demand alone will drive the market size to RMB 11 billion (based on the networking of 2 million TPUs). Combined with the exploration of optical switching by other cloud vendors and ASIC vendors, the market potential will be further amplified. However, OCS is still in the early stages of commercialization and faces challenges such as insufficient technical maturity, high cost (Single device costs tens of thousands of dollars), and positioning differences with traditional electrical switches (such as CPO). In addition, the customer verification cycle in the sample testing phase is long, and it will take time for large-scale implementation. In the future, with the evolution of optical modules to 800G/1.6T and the upgrade of data center network architecture (such as liquid cooling and optoelectronic fusion), OCS will accelerate its penetration into the fields of ultra-large-scale distributed training and AI model deployment, and is expected to complement technologies such as CPO and OIO in the long term.
