According to our (Global Info Research) latest study, the global OCT Imaging Catheter market size was valued at US\$ 165 million in 2025 and is forecast to a readjusted size of US\$ 296 million by 2032 with a CAGR of 8.7% during review period.

OCT Imaging Catheter is a single-use, sterile, high-precision disposable medical device used in conjunction with an Optical Coherence Tomography (OCT) system for intravascular imaging. The catheter integrates a miniature optical probe that is inserted into the coronary or peripheral arteries, emitting near-infrared light to capture cross-sectional images of the vessel wall with micrometer-level resolution (10-20 μ m). This technology is widely recognized as the 'third eye' of interventional cardiologists, enabling real-time visualization of vascular microstructure, plaque characterization, stent optimization, and guidance for complex percutaneous coronary intervention (PCI) procedures.

The upstream segment includes suppliers of optical fibers, micro-lenses, micro-motor assemblies, rapid-exchange delivery systems, medical-grade polymers, and hydrophilic coatings. The midstream segment encompasses precision assembly, optical alignment, sterilization (EtO), functional testing, and quality packaging performed by specialized medical device manufacturers. OCT imaging catheters are categorized by compatibility into catheters for standalone OCT systems and catheters for hybrid IVUS+OCT dual-modality systems; by application into coronary artery catheters (for PCI guidance) and peripheral artery catheters (for PAD treatment); by technology generation into conventional OCT catheters (require contrast flushing) and next-generation self-contained catheters (sealed optics, no flushing required); and by imaging mode into forward-imaging (CTO crossing) and side-imaging (lumen assessment) catheters. The

downstream segment serves interventional cardiology departments of hospitals, ambulatory surgery centers, and catheterization laboratories through medical device distributors and direct sales.

The global average selling price for OCT imaging catheters is approximately US\$130 per unit (manufacturer/distributor level), with annual sales volume reaching approximately 1.23 million units in 2025. The industry maintains gross margins between 50% and 70% , reflecting the high-precision manufacturing requirements, proprietary optical assembly technology, and value-based pricing in the interventional cardiology market.

The global OCT imaging catheter market is experiencing rapid growth, driven by the increasing adoption of precision-guided percutaneous coronary intervention (PCI) procedures, the expanding clinical evidence supporting OCT-guided stent optimization, and the ongoing shift from angiography-guided to intravascular imaging-guided interventions. OCT technology provides 10-fold higher resolution than intravascular ultrasound (IVUS), enabling visualization of critical structures such as stent strut apposition, edge dissection, tissue prolapse, and in-stent restenosis with unprecedented clarity.

A notable trend reshaping the market is the rise of multi-modality imaging catheters. Traditional OCT systems require a dedicated single-modality catheter, while next-generation hybrid catheters combine OCT with IVUS technology on a single platform. Products such as NOVASIGHT? HYBRID SYSTEM integrate IVUS ultrasound transducer and OCT imaging core on the same catheter, delivering automatically co-registered dual-modality images in a single pullback without increasing catheter diameter. This innovation allows interventionalists to obtain both deep vessel penetration (IVUS) and high-resolution surface detail (OCT) simultaneously, optimizing treatment strategies and reducing procedure time.

Another significant development is the emergence of next-generation OCT catheters with fully enclosed optical designs. Unlike conventional catheters that require contrast agent flushing to clear blood from the imaging field, new self-contained catheters seal the imaging lens inside the catheter body, eliminating the need for contrast flushing and enabling plug-and-play operation. This technology significantly reduces procedure time and contrast usage?particularly beneficial for patients with renal impairment?while maintaining or improving image quality.
