Abstracts

The global Octyl Triazone market size is expected to reach \$ 153 million by 2032, rising at a market growth of 5.8% CAGR during the forecast period (2026-2032).

In 2025, global Octyl Triazone production reached approximately 4,570 tons, with an average global market price of around US\$22 per kilogram. Octyl Triazone, also known as Ethylhexyl triazone (INCI), is a commonly used organic UV filter in cosmetics and sunscreens. It is an organic compound used in sunscreens to absorb UVB radiation. Ethylhexyl triazone has an absorption maximum of 314 nm.

Public information suggests that Octyl Triazone is a high-efficiency UVB filter whose commercial value comes from performance rather than dosage. Official product pages consistently describe it as effective at low use levels, photostable, and suitable for water-resistant formulations, which means demand is tied more to premium sunscreen and multifunctional skin-care formulas than to mass-volume commodity use. The supply side therefore tends to be shaped by formulation expertise, purification capability, and regulatory compliance across regions rather than by raw capacity alone. In the EU, Octyl Triazone is listed as an allowed UV filter with a maximum concentration of 5%, reinforcing that this is a regulated, specification-driven ingredient with meaningful entry barriers. As consumer expectations move toward higher SPF, lighter textures, and better wear performance, the category should continue to benefit from steady demand, while supply growth is likely to remain more selective and slower than in mainstream base ingredients.

This report studies the global Octyl Triazone production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Octyl Triazone and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2025 as the base year.
