## Abstracts

According to our latest research, the global Offshore Carbon Storage Technology market size will reach USD million in 2031, growing at a CAGR of %over the analysis period.

Offshore Carbon Storage Technology involves capturing carbon dioxide (CO<sub>2</sub>) emissions from industrial sources and transporting them to offshore sites, where they are injected into deep geological formations beneath the seabed for long-term storage. This technology is a key component of carbon capture and storage (CCS) efforts aimed at reducing greenhouse gas emissions and mitigating climate change. Offshore storage sites, such as depleted oil and gas reservoirs or deep saline aquifers, offer significant capacity and isolation from populated areas. The technology is being developed and deployed in regions with favorable geological conditions and strong regulatory frameworks, particularly in Europe and North America, as part of global efforts to achieve net-zero emissions.
