## **Abstracts**

The most commonly chosen solution for offshore communications are satellite communications, which require a VSAT at the offshore site and are used many times for vessels that may be in extremely remote locations or on the move. With the help of microwave telecommunications technology, data is transported via wavelengths that measure less than one meter in length. These microwave solutions are chosen for locations that are within proximity to each other. Fiber optical telecommunications are chosen for locations that are in high traffic areas, such as the North Sea or US Gulf of Mexico. Even cellular telecommunications services can be accessible at some places offshore. US Gulf of Mexico has cellular towers installed offshore that allow these cellular communications from rigs and platforms near the coast to onshore locations. All these technologies will lead to the growth of the offshore oil & gas communications market.
