The global Offshore Wind Shaft Bearings market size is expected to reach \$ 2309 million by 2032, rising at a market growth of 8.1% CAGR during the forecast period (2026-2032).

In 2025, global Offshore Wind Shaft Bearings production reached approximately 15,854 units, with an average global market price of around USD 82,000 per unit.

The gross profit margin of major companies in the industry is between 18.42%-33.86%.

In 2025, the global production capacity of Offshore Wind Shaft Bearings was approximately 20,860 units.

Offshore Wind Shaft Bearings are large precision bearings used in offshore wind turbines to support the main shaft and transfer rotor loads to the drivetrain. They must withstand high radial and axial loads, variable wind conditions, salt spray, vibration, long maintenance intervals and harsh offshore environments. Common structures include spherical roller bearings, tapered roller bearings and customized main bearing units for large-megawatt turbines. The product is used in offshore wind nacelles and drivetrain systems, but excludes yaw bearings, pitch bearings, gearbox bearings and complete turbine drivetrains.

The industry chain includes bearing steel, forgings, rings, rollers, cages, seals, lubricants, heat treatment services, grinding equipment and large bearing testing systems. Midstream production covers forging, heat treatment, turning, grinding, assembly, clearance control, sealing, lubrication, load testing and reliability validation. Downstream demand comes from offshore wind turbine manufacturers, drivetrain

suppliers, wind farm developers, maintenance service providers and replacement markets. Growth is driven by offshore wind capacity additions, larger turbine ratings, longer design life, localization requirements and replacement demand from operating fleets.

This report studies the global Offshore Wind Shaft Bearings production, demand, key manufacturers, and key regions.
