The global OGI Optical Gas Imager market size is expected to reach \$ 769 million by 2032, rising at a market growth of 6.0% CAGR during the forecast period (2026-2032).

OGI (Optical Gas Imaging) is a technology that uses specialized cameras to detect and visualize gas leaks. An OGI camera, also known as an optical gas imager, is designed to detect and display the presence of various gases in real-time. The OGI optical gas imager works by utilizing infrared technology to capture images of gas leaks. It can detect a wide range of gases, including volatile organic compounds (VOCs), hydrocarbons, and other hazardous gases. The camera is equipped with a specific filter that allows it to visualize the gas emissions, making them visible to the operator. OGI optical gas imagers are advanced tools that utilize infrared technology to detect and visualize gas leaks. They provide real-time imaging, enhanced sensitivity, and non-contact detection, making them valuable for gas leak detection and prevention in various industries. In 2025, global OGI Optical Gas Imager production reached approximately 15,697 Units, with an average global market price of around K US\$ 31.65 per unit.

The overall OGI optical gas imaging market is in a steady growth stage, mainly driven by stricter environmental regulations and increased carbon reduction requirements, especially in the oil and gas industry where the demand for core equipment for leak detection (LDAR) continues to expand. At the same time, applications in chemical, power and other fields are gradually penetrating; From the perspective of technological trends, products are developing towards high sensitivity, multi gas recognition, and integration with drones and intelligent analysis systems. However, high equipment costs and professional usage barriers still pose certain constraints on market expansion, presenting an overall development characteristic of 'obvious policy driven, high

technological barriers, and gradually expanding applications'.
