According to our (Global Info Research) latest study, the global Oil Extended Styrene Butadiene Rubber market size was valued at US\$ 12043 million in 2025 and is forecast to a readjusted size of US\$ 16396 million by 2032 with a CAGR of 4.5% during review period.

Oil Extended Styrene Butadiene Rubber (OE-SBR) is a modified form of emulsion or solution SBR in which processing oil is incorporated during polymerization, producing a rubber with lower Mooney viscosity, improved filler dispersion, and enhanced processability without sacrificing tensile strength or abrasion resistance. It is widely used in passenger and truck tires (treads, sidewalls, and inner components), conveyor belts, footwear, hoses, and molded rubber goods where consistent compound flow and cost efficiency are critical. The supply chain begins with upstream petrochemical feedstocks—styrene, butadiene, and aromatic or naphthenic process oils—derived from refinery and steam-cracker streams. These are polymerized by SBR producers using emulsion or solution processes, with oil metered in situ to achieve controlled extension levels (typically 15–50 phr). The rubber is then coagulated, dried, and baled or pelletized before moving to midstream compounders and tire OEMs, who blend it with carbon black, silica, curatives, and additives. Downstream, OE-SBR is converted into semi-finished compounds and finished rubber components by tire manufacturers and industrial rubber fabricators, forming a tightly integrated value chain linking refineries, synthetic rubber producers, compounders, and end-use OEMs. In 2025, global OE-SBR output reached about 7.6 million tons versus 9.2 million tons of capacity, with prices of USD 1,450–2,300 per ton and average gross margins near 29%.
