Abstracts

The global Oil-Immersed Amorphous Alloy Transformer market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Oil-immersed amorphous alloy transformer is a special type of transformer in which the transformer core uses oil-immersed amorphous alloy material. Amorphous alloy is a special metal material with an amorphous structure and has the characteristics of low hysteresis, low loss and high saturation magnetic induction intensity. Oil-immersed amorphous alloy transformers utilize the characteristics of amorphous alloy materials to achieve higher energy transmission efficiency and lower energy loss. It has higher work efficiency, smaller size and weight, and lower noise and vibration levels. In addition, oil-immersed amorphous alloy transformers also have good temperature stability and short-circuit resistance. Oil-immersed amorphous alloy transformers are widely used in power systems, industrial fields, and energy fields, etc., for power conversion and distribution tasks such as voltage transformation, voltage boost, step-down, and power distribution. Compared with traditional crystalline silicon steel sheet transformers, oil-immersed amorphous alloy transformers have higher efficiency and better performance, which can improve the efficiency of power transmission and distribution and reduce energy losses.
