## Abstracts

The global Oil Immersed Single Phase Shunt Reactor market size is expected to reach \$ 667 million by 2032, rising at a market growth of 5.4% CAGR during the forecast period (2026-2032).

An oil immersed single phase shunt reactor is a high-voltage, inductive electrical device used in AC power transmission systems to compensate for capacitive reactive power generated by lightly loaded transmission lines or underground cables. In 2025, global oil immersed single phase shunt reactor production reached approximately 271 K unit, with an average global market price of around USD 1,650K per K unit. A factory gross profit of USD 445 per unit with 27% gross margin. A single line full machine capacity production is around 26 K unit per line per year. downstream demand is concentrated in utilities, industrial and energy integration. In an AC transmission line shunt reactors used at line ends and intermediate substations to absorb excess reactive power, stabilize voltage and reduce transmission losses. China leads the market in both consumption and production, driven by UHVDC rollouts and massive renewable energy projects.
