Abstracts

According to our (Global Info Research) latest study, the global Oil Monitoring Sensor market size was valued at USD 710 million in 2022 and is forecast to a readjusted size of USD 1153.4 million by 2029 with a CAGR of 7.2% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The oil online monitoring system integrates a variety of sensor functions, which can automatically detect moisture, density, viscosity, dielectric constant, water activity, pollution, wear particles and temperature. The internal real-time collected data is analyzed and processed by wired or wireless means and then sent to the monitoring terminal and the cloud, which can be remotely monitored through mobile phones or computers. In addition, the oil analysis technology that is mainly used in laboratory testing at present is mainly laboratory analysis instruments, which have some inherent problems, such as the detection time is too long, the testing equipment is expensive, the volume is large, and the dependence on the quality of personnel is relatively high. Large, sampling is required, the inspection period is too long, and the application area is limited, so it is not suitable for large-scale real-time monitoring. In this case, it is particularly important to develop new on-line monitoring sensors. On-line monitoring technology is called the direction of future oil monitoring for its timeliness and ease of maintenance. Online monitoring generally only takes a few minutes to complete a measurement, and the results are automatically entered into the database. The real-time performance is good, and no sampling is required, and the oil in the oil return pipe or tank is directly analyzed, avoiding the problems of unrepresentative sampling and secondary pollution. At the same time, it also solves the problem of difficult sampling and reduces the labor cost of sampling.
