Oil analysis sensors are devices used to monitor and analyze the status of oil in real time. They evaluate the quality, contamination level, wear condition and lubrication performance of oil by detecting various physical, chemical or mechanical characteristics in oil. These sensors are commonly used in various mechanical equipment such as engines, gearboxes, hydraulic systems, etc. to ensure the normal operation of equipment and optimize maintenance work.

Oil parameter analysis sensors are developing towards high precision, intelligence, miniaturization and multi-parameter integration, and widely apply technologies such as micro-nano manufacturing, MEMS, spectral analysis and artificial intelligence to achieve real-time online monitoring of key parameters such as oil viscosity, moisture, and pollutants. In the future, such sensors will promote their wide application in industrial equipment maintenance, intelligent transportation, and aerospace while improving reliability and environmental adaptability.
