Abstracts

The global Oil-removal Hydrocyclone market size is expected to reach \$ 1306 million by 2032, rising at a market growth of 4.5% CAGR during the forecast period (2026-2032).

In 2025, global oil-removal hydrocyclone production reached approximately 4440 units, the average price is 210 k usd/unit. Oil-removal hydrocyclones are compact centrifugal separation devices used for treating produced water from oil and gas fields and oily wastewater from refining plants. They provide a high-speed swirling field to the incoming liquid through a tangential inlet, causing the lighter oil droplets to coalesce towards the low-pressure zone at the axis and flow out through the overflow outlet, while the denser wastewater and solid particles are thrown towards the wall and discharged through the bottom outlet. There are no rotating parts throughout the process, and the initial separation of oil, water, and solid phases is achieved by the flow field itself. A single unit can process several to hundreds of cubic meters per hour. Multiple units are often connected in parallel to form a skid. It is a core piece of equipment for replacing traditional oil separators on offshore platforms and onshore joint stations, and is also used in the pretreatment lines for fracturing flowback fluid and drilling mud oil removal.

The gross profit margin of oil-removal hydrocyclones is around 25%.
