Abstracts

The global Oil Soluble Metal Deactivator market size is expected to reach \$ 1674 million by 2032, rising at a market growth of 3.5% CAGR during the forecast period (2026-2032).

In 2025, global Oil Soluble Metal Deactivator production reached approximately 84,000 tons with an average global market price of around US\$ 15000 per ton, and a gross profit margin of approximately 20%-40%. Oil Soluble Metal Deactivator is a class of lubricant/fuel additive designed to reduce or switch off the catalytic activity of trace metals especially copper and copper alloys (yellow metals), but also iron and other transition metals that accelerate oxidation and deposit formation in hydrocarbon systems. In oils and fuels, even ppm-level dissolved metal ions or contact with active metal surfaces can promote free-radical autoxidation by decomposing hydroperoxides into new radicals, which rapidly consumes antioxidants and shortens oxidation induction time. The practical consequences include faster darkening, acid number increase, viscosity rise, gum/insolubles, sludge/varnish deposits, and reduced service life of the fluid.

The upstream mainly consists of raw materials for basic and fine chemicals: aromatic/heterocyclic intermediates (such as key intermediates in the benzotriazole/toluenetriazole route), sulfur- and nitrogen-containing intermediates (thiadiazole, dithiocarbamate, thiourea/thiocyanate related), aldehydes/amines for Schiff base complexation structures, and solvents and carrier oils (mineral oil/PAO/esters, etc.). The midstream involves the synthesis, manufacturing, and commercialization of metal deactivators: including the functionalization of heterocyclic compounds (improving oil solubility and thermal stability), the reaction and purification of sulfur- and nitrogen-containing polar molecules, and the formulation of active ingredients into liquid concentrates (usually soluble in solvents or base oils) and compatibility design with antioxidants, corrosion inhibitors, dispersants, anti-wear/extreme pressure agents, etc.

Downstream, the products mainly enter two major markets: one is the fuel additive chain (improving stability at refinery outlets, pipelines/storage, and end-users, and inhibiting oxidation and gumming caused by trace metals); the other is lubricating oils and industrial fluids (hydraulic oil, gear oil, turbine oil, compressor oil, grease, and some oil-based processing fluids), focusing on solving the problems of catalytic oxidation, sludge/varnish, and deposition in brass/copper components.
