Oil Spill Prevention Dam is a type of equipment used to prevent oil spills in the ocean. Often located near drilling platforms in offshore fields, it is a-like structure that creates an enclosed area in the ocean for collecting and storing leaked oil. Oil spill dams need to be designed and constructed to consider a variety of factors, such as the marine environment, the amount and velocity of oil spilled, ocean dynamics, and more. Typically, oil spill dams consist of breakwaters, oil collection systems, leak control equipment, etc. In the event of a spill, oil spill dams can quickly activate and collect the spilled oil, thereby reducing damage to the marine ecosystem.
