An oil-immersed transformer bushing is an insulating component usually used in oil-immersed transformers. The interior of the bushing is filled with insulating oil, which acts as an insulator, coolant, and arc quencher. Oil-immersed transformer bushings are one of the important components that ensure the normal operation of transformers. They can effectively prevent local discharge caused by environmental factors, reduce the impact of local discharge, and prolong the service life of oil-immersed transformers. Oil-immersed transformer bushings are usually made of ceramics or mica paper because these materials have good mechanical properties, insulation performance, high temperature resistance, and aging resistance. During transformer operation, oil-immersed transformer bushings are subjected to a large electric field, voltage, current, and temperature, so they need to have high strength, insulation, and voltage resistance.
