According to our (Global Info Research) latest study, the global Oil Well Hydraulic Fracturing Proppant market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Oil well hydraulic fracturing proppant is also called Fracking proppants. In oil and gas deep well extraction, high closure pressure low permeability deposits are fractured to fracture treatment, so that the oil and gas bearing rock formation is cracked, and oil and gas are pooled from the channel formed by the fracture, at this time, fluids need to be injected into the rock base layer to exceed the fracture strength of the formation pressure, so that the rock formation around the wellbore will produce a fracture and form a channel with high-level flow capacity, in order to keep the fracture formed after fracturing open, and the oil and gas products can be smoothly Passage. Petroleum proppant is used to enter the formation along with the high-pressure solution to fill in the fractures in the rock formation, which plays the role of supporting the fractures not to be closed due to the stress release, so as to maintain a high flow-conducting capacity, make the oil and gas flow smoothly, and increase the production.
