The global Oil Well Hydraulic Fracturing Proppant market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Oil well hydraulic fracturing proppant is also called Fracking proppants. In oil and gas deep well extraction, high closure pressure low permeability deposits are fractured to fracture treatment, so that the oil and gas bearing rock formation is cracked, and oil and gas are pooled from the channel formed by the fracture, at this time, fluids need to be injected into the rock base layer to exceed the fracture strength of the formation pressure, so that the rock formation around the wellbore will produce a fracture and form a channel with high-level flow capacity, in order to keep the fracture formed after fracturing open, and the oil and gas products can be smoothly Passage. Petroleum proppant is used to enter the formation along with the high-pressure solution to fill in the fractures in the rock formation, which plays the role of supporting the fractures not to be closed due to the stress release, so as to maintain a high flow-conducting capacity, make the oil and gas flow smoothly, and increase the production.
