According to our (Global Info Research) latest study, the global OIS Controller IC market size was valued at US\$ 401 million in 2025 and is forecast to a readjusted size of US\$ 965 million by 2032 with a CAGR of 13.3% during review period.

An OIS controller IC is the core control and drive chip used in mobile imaging modules. Its main function is to receive signals such as gyroscope data, Hall or position feedback during handheld shake or device motion, calculate compensation in real time, and drive miniature actuators such as VCM, piezo, or SMA devices to move the lens or related optical components, thereby reducing blur and improving stability in low-light photography, telephoto shooting, and video recording. Based on official product pages, these chips have evolved from simple drivers into system-level devices integrating a CPU or DSP, flash or EEPROM, ADCs, communication interfaces, Hall signal processing, PID control, and H-bridge drivers. The category includes combination controllers that support both OIS and open-loop AF, as well as single-chip eOIS solutions integrating Si Hall sensing and H-bridge circuitry. Their main customers are smartphone brands, camera module makers, and imaging solution providers. Common delivery forms are ultra-small packages such as WLCSP, typically supported by datasheets, evaluation boards, application notes, and reference designs. As higher-resolution cameras, multi-camera systems, folded telephoto modules, AI imaging, and lighter terminal devices continue to evolve, competition in OIS controller ICs is shifting from simply enabling stabilization to delivering higher precision, faster response, and stronger system-level coordination within smaller size and lower power envelopes.

The industry value of OIS controller ICs is moving beyond the role of a standalone driver and becoming that of a core control node inside mobile imaging modules. Based

on official materials from Renesas, onsemi, Awinic, Halo Microelectronics, and MEMSIC, these chips are no longer simple analog devices that merely output drive current. They are increasingly integrating CPUs or DSPs, memory, ADCs, communication interfaces, Hall signal processing, PID control, and H-bridge drivers, thereby forming system-level devices with sensing, computing, and closed-loop execution capabilities. For smartphone brands and camera module makers, this means that an OIS controller IC is not just a stabilization component, but a key element that determines response speed, control accuracy, power consumption, and system tuning efficiency. As multi-camera systems, telephoto modules, night photography, and video recording continue to advance, the importance of OIS controller ICs is likely to keep increasing.

From a product roadmap perspective, the industry currently shows at least two clear directions. The first is the OIS-and-AF combination route, where OIS and open-loop AF or related focus control are implemented in the same chip, reducing external components and module complexity while improving space efficiency and customer integration efficiency. The second is the single-chip eOIS route, which integrates Hall sensing, drive functions, and control algorithms into a smaller package to fit thinner, smaller, and lower-power module designs. Official information from Southchip, MEMSIC, and Halo shows that closed-loop control, Hall feedback, PID tuning, and high-precision drive capability have become major competitive priorities. Looking ahead, as folded telephoto modules, AI glasses, drones, VR devices, and other new terminals expand, OIS controller ICs may gradually evolve from smartphone imaging chips into key control platforms for a broader range of mobile vision terminals.

From a competitive standpoint, this remains a category with a very strong East Asian supply-chain profile. Japanese vendors retain deep experience in high-end OIS and AF control LSIs, Korean vendors remain closely tied to local smartphone and camera ecosystems, and mainland Chinese vendors have accelerated significantly in recent years, moving from follower-style participation toward competition in closed-loop, high-precision, and system-level solutions. Overall, I am optimistic about the sector's outlook. As long as mobile terminals continue upgrading around imaging performance, and as long as consumers continue to value night photography, telephoto clarity, and video stability, the per-device value and technical barriers of OIS controller ICs are unlikely to decline. Instead, they may be amplified further as the value of each camera module rises. The core of future competition is no longer simply whether a device has OIS, but who can make OIS more stable, smaller, more power-efficient, and easier to integrate.
