Abstracts

The global OLED ACF market size is expected to reach \$ 304 million by 2032, rising at a market growth of 6.2% CAGR during the forecast period (2026-2032).

OLED ACF (Organic Light Emitting Diode Anisotropic Conductive Film) is a specialized anisotropic conductive film used to electrically and mechanically connect components within OLED display modules. It consists of a thermosetting adhesive film containing conductive particles that conduct electricity only in the Z-axis (vertical direction) while remaining electrically insulating in the X-Y plane (horizontal direction).

OLED ACF is primarily used in bonding processes such as Chip-on-Film (COF), Chip-on-Glass (COG), Flex-on-Panel (FOP), and Flex-to-Board (FTB), enabling high-density electrical connections between OLED panels, driver ICs, flexible circuits, and printed circuit boards.

2025, global OLED ACF sales volume reached 1.95 million sqm, with average price of 100 US\$ per sqm.

OLED ACF demand is shifting toward ultra-fine-pitch and high-density bonding. As OLED displays move toward higher resolution, narrower bezels, thinner modules, and higher refresh rates, display makers require ACF materials that can support smaller electrode spacing, stable conductive particle distribution, low contact resistance, and reliable COG, COF, FOP, and FTB bonding. This trend is especially important in smartphones, tablets, notebook OLED panels, wearable displays, and high-end automotive OLED modules.

Flexible and foldable OLED products are raising material performance requirements.

Compared with conventional rigid LCD panels, OLED panels increasingly use flexible substrates and thinner module structures, which expose bonding materials to bending stress, thermal stress, humidity, and repeated mechanical deformation. As a result, OLED ACF is evolving toward better flexibility, stronger adhesion, lower curing temperature, improved moisture resistance, and long-term electrical stability, especially for foldable phones, curved displays, smartwatches, and flexible automotive displays.

Suppliers are competing through reliability, process compatibility, and customized formulations. OLED panel production requires stable bonding yield, precise particle control, narrow process windows, and compatibility with automated bonding equipment. Therefore, ACF suppliers are developing low-temperature, fast-curing, ultra-fine-pitch, and high-reliability products tailored to different OLED panel structures and customer bonding processes. Companies with strong formulation capability, quality consistency, technical support, and mass-production validation experience are better positioned in the OLED ACF market.

This report studies the global OLED ACF production, demand, key manufacturers, and key regions.
